

INTERGRAV™ PROJECT MANAGEMENT SYSTEM

INTERGRAV™ is Fugro-LCT's interactive system to supply our Clients with the most effective gravity and magnetic package available today. INTERGRAV™ takes the individual components of a geophysical survey: **Survey Planning, Data Acquisition, Data Processing, Quality Control, and Delivery of Final Products**, and moulds them into a streamlined **integrated** process. INTERGRAV™ revolves around a seamless system of Client communications. Clients will receive Fugro-LCT reports each week that provide up to date information about all phases of their project from survey preparation through to data delivery.

Typical data snapshot from a weekly Integrav report

During the acquisition phase all data from weekly data samples and intermediate data drops are QC processed and forwarded to the client with feedback to Fugro-LCT's onboard operator. The weekly INTERGRAV™ progress reports include samples showing the raw and processed data quality and VMON value for typical data acquired during the previous week.

Following an intermediate data drop, the INTERGRAV™ report will include screen images showing the line-to-line correlation of QC processed free-air gravity and magnetic anomaly and a colour display showing the VMON value for all data. In this way the client is kept fully aware of the quality of the data being acquired.

Not only does this monitor the correct function of the gravity system but also allows decisions such as the suitability of tie-lines acquired in marginal weather or during transits to be made in an informed manner.
